INTRODUCTION

This report presents the combined results for the 29 counties that took part in the South Carolina Communities That Care (SC CTC) Survey in January and February 2010. The SC CTC Survey was sponsored by the Community Action for a Safer Tomorrow (CAST) project. CAST is administered by the South Carolina Department of Alcohol and Other Drug Abuse Services (DAODAS) with funding from the Center for Substance Abuse Prevention of the U.S. Substance Abuse and Mental Health Services Administration. This report was prepared by the Pacific Institute for Research and Evaluation (PIRE).

The 29 counties that participated in the survey are as follows: Abbeville, Anderson, Bamberg, Barnwell, Berkeley, Cherokee, Chesterfield, Clarendon, Colleton, Darlington, Dillon, Fairfield, Florence, Georgetown, Greenwood, Hampton, Horry, Jasper, Kershaw, Marlboro, McCormick, Newberry, Oconee, Orangeburg, Pickens, Saluda, Sumter, Williamsburg, and York.

Notes about Data Included in This Report

The results contained in this report are based on weighted data. The purpose of weighting the data was to better represent the larger student population, in the counties, from which the surveyed students were drawn. We weighted the data according to characteristics that are known to be associated with substance use. For example, substance use is known to vary by grade and race/ethnicity. For this reason, we weighted the survey data by grade level (9-12) and race/ethnicity (white, non-white) so that the students who were surveyed would better reflect the county's student population and the survey results would be more accurate. Students' self-reported race/ethnicity was coded into two categories, white and "other." The "other" category includes students who self-identified as something other than white, as well as those who indicated multiple races/ethnicities. The number of race/ethnicity categories was limited to two because the number of surveys was not sufficient for examining a larger number of categories.

Although the weighting methods were designed to help improve the accuracy of the results, they nonetheless have some limitations. To preserve as much survey data as possible, we used a liberal threshold for acceptable weights. As such, the resulting estimates may be, in some cases, heavily influenced by the responses of a small number of students. This may be particularly true with respect to the results that are broken out by grade level. This should be kept in mind when interpreting these results.

In some cases, county data were not obtained from a sufficient number of students in a particular grade and/or race/ethnicity category to be included in the analysis. The rationale in making this assessment was that the few students who were surveyed may under- or over-represent the true prevalence of the behavior among that group of students in the county. As noted earlier, we preserved as much of each county's data as possible when conducting the analyses. The table below indicates the number of students surveyed in each grade-race/ethnicity category.

Data used in analysis, for the 29 counties, combined, that participated in the SC CTC Survey

	9 th / white	9 th / other	10 th / white	10 th / other	11 th / white	11 th / other	12 th / white	12 th / other	Total*
29 Counties Combined	6141	4955	1520	2162	4195	3231	829	1155	24593

*Note that the total number of students exceeds the sum of the grade-race/ethnicity cells. This is due to students who did not report a grade and/or race/ethnicity.

Presenting Results by Grade and Overall

In the report, the results are displayed by grade and for all grades combined. For each survey item, these are shown as separate tables. For each graph or set of tables in the report, reference is made to the associated survey item number (SF = Short Form version of the survey; LF = Long Form version of the survey).

Coding of Response Categories

The items in the survey offered multiple response options to respondents. To allow for ease of interpretation, we recoded most items. Most often, items were coded into two response categories. For example, in the case of substance use questions, frequency-of-use response options were collapsed into use vs. no use. For each item, the categories that were used in the analysis are noted in the tables in the report.

Rounding Percentages Presented in the Tables

The results provided in the tables are reported to four decimal places. This likely provides more precision in the estimates than is warranted or is useful for reporting needs. Rounding to one decimal place is likely sufficient. One approach for doing so is to first look to the last three decimal places. If the value of those numbers is greater than or equal to 500, round up. If the value is less than 500, round down. For example, if the percentage provided in the table is 28.6533, look to the last three digits (533) and note that it is larger than 500. Therefore, the first decimal place can be rounded up to yield a figure of 28.7. Likewise, if the percentage is 34.2312, note that the last three digits (312) are less than 500 such that the first decimal place can be rounded down, yielding an estimate of 34.2.

Comparing County Results to the Combined Results for the 29 Counties

Interpretation of a particular county's results may include comparison to these combined results for the 29 counties that took part in the SC CTC survey. The combined results for the 29 counties that took part in the survey should not be interpreted as estimates for the entire state population but rather as estimates for only the counties that participated in the survey.

Inclusion of Confidence Intervals in the Tables and Graphs

The percentages presented in the tables in the report are accompanied by 95% confidence intervals (referred to in the tables as "95% Confidence Limits for Percent"). The graphs in the report also display confidence intervals, which appear as thin black bands on the bars representing the percentages in each graph. In comparing a particular county's results to the combined results for the 29 counties, differences in behaviors (attitudes, etc.) between the two

can be considered statistically significant if the confidence intervals for the county and all 29 counties (as represented in the tables or the graphs) do not overlap.

Confidence intervals are taken into account because the survey results are drawn from a sample of students in the counties and, as such, they can be interpreted as estimates of the true values (of the behaviors, attitudes, etc.) in the population. The 95% confidence interval indicates that we can be 95% sure that the true prevalence of the behavior falls within the stated confidence limits presented in the table. As noted, confidence intervals help in assessing whether results are statistically significantly different from each other (e.g., whether a particular county's prevalence of alcohol use is statistically significantly higher or lower than the prevalence of alcohol use for all 29 counties combined).
