South Carolina Communities That Care (SC CTC) Survey

South Carolina

2014 Results

INTRODUCTION

This report presents statewide results of the South Carolina Communities That Care (SC CTC) Survey. The SC CTC Survey was sponsored by the Community Action for a Safer Tomorrow (CAST) project. CAST is administered by the South Carolina Department of Alcohol and Other Drug Abuse Services (DAODAS) with funding from the Center for Substance Abuse Prevention of the U.S. Substance Abuse and Mental Health Services Administration. The survey was administered in 21 counties in South Carolina in February and March 2014. This report was prepared by the Pacific Institute for Research and Evaluation (PIRE).

Notes about Data Included in This Report

The results contained in this report are complementary to the statewide results distributed in July 2014. Whereas the July 2014 report provided results for a limited number of items, the current report provides results for each item in the survey. We also provide results for each response option available for each item.

As in the July 2014 report, these results are based on weighted data. The purpose of weighting the data was to better represent the larger student population, in the county, from which the surveyed students were drawn. We weighted the data according to characteristics that are known to be associated with substance use. For example, substance use is known to vary by grade and race/ethnicity. For this reason, we weighted the survey data by grade level and race/ethnicity (white, non-white) so that the students who were surveyed would better reflect the county's student population and the survey results would be more accurate. Students' self-reported race/ethnicity was coded into two categories, white and "other." The "other" category includes students who self-identified as something other than white, as well as those who indicated multiple races/ethnicities. The number of race/ethnicity categories was limited to two because the number of surveys was not sufficient for examining a larger number of categories.

Although the weighting methods were designed to help improve the accuracy of the results, they nonetheless have some limitations. To preserve as much survey data as possible, we used a liberal threshold for acceptable weights. As such, the resulting estimates may be, in some cases, heavily influenced by the responses of a small number of students. This may be particularly true with respect to the results that are broken out by grade level. This should be kept in mind when interpreting these results. The table below indicates the number of students surveyed in each grade-race/ethnicity category.

Data used in analysis

	9th / white	9th / other	10th / white	10th / other	11th / white	11th / other	12th / white	12th / other	Total*
South Carolina	5,235	3,915	920	899	3,639	2,816	635	689	18,889

*Note that the total number of students may exceed the sum of the grade-race/ethnicity cells. This is due to students who did not report a grade and/or race/ethnicity.

Presenting Results by Grade and Overall
In the report, the results are displayed by grade and for all grades combined. For each survey item, these are shown as separate tables. For each set of tables in the report, reference is made to the associated survey item number, which can be found in the upper left of each table. For the tables that provide results by grade, the appropriate columns to interpret are the "row percent" and "95% confidence limits for row percent" columns. The figures in these columns represent the percentage of students *within the given grade* who provided that particular response.

Rounding Percentages Presented in the Tables
The results provided in the tables are reported to four decimal places. This likely provides more precision in the estimates than is warranted or is useful for counties' reporting needs. Rounding to one decimal place is likely sufficient. One approach for doing so is to first look to the last three decimal places. If the value of those numbers is greater than or equal to 500, round up. If the value is less than 500, round down. For example, if the percentage provided in the table is 28.6533, look to the last three digits (533) and note that it is larger than 500. Therefore, the first decimal place can be rounded up to yield a figure of 28.7. Likewise, if the percentage is 34.2312, note that the last three digits (312) are less than 500 such that the first decimal place can be rounded down, yielding an estimate of 34.2.

Empty Cells in the Tables
Note that some tables may contain empty cells. These instances can be interpreted as 0%. The computer program used to analyze the data generates an empty cell by default whenever the estimate is 0%. Estimates of 0% are most likely to be generated when the number of students surveyed is small and/or when the question pertains to a rare behavior such as lifetime heroin use.

Comparing County Results to the Combined Results for the 21 Counties
Interpretation of county results may include comparison to the combined results for the 21 counties that took part in the SC CTC survey. The results contained in this report, however, should not be interpreted as estimates for the entire state population but rather as estimates for only the 21 counties that participated in the survey.

Inclusion of Confidence Intervals in the Tables
The percentages presented in the tables in the report are accompanied by 95% confidence intervals (referred to in the tables as "95% Confidence Limits for Percent"). In comparing the county's results to the combined results for the 21 counties, differences in behaviors (attitudes, etc.) between the two can be considered statistically significant if the confidence intervals for the county and all 21 counties (as represented in the tables) do not overlap.
Confidence intervals are taken into account because the survey results are drawn from a sample of students in the county and, as such, they can be interpreted as estimates of the true values (of the behaviors, attitudes, etc.) in the population. The 95% confidence interval indicates that we can be 95% sure that the true prevalence of the behavior falls within the stated confidence limits presented in the table. As noted, confidence intervals help in assessing whether results are statistically significantly different from each other (e.g., whether the county's prevalence of alcohol use is statistically significantly higher or lower than the prevalence of alcohol use for all 21 counties combined).

RESULTS

1. How old are you?
